

# Question 18

- Which of the following complications should be high-on the differential diagnosis in evaluating a patient with abdominal pain soon after aortic aneurysm endovascular repair, except:
  - A. Leakage of blood in the aneurysm sac due to leakage at proximal or distal anastamotic sites
  - B. Expansion of the parent aneurysmal sac due to retrograde flow from lumbar and mesenteric arteries
  - C. Leakage of blood through the endograft material
  - D. Renal, mesenteric or iliac ischemia
  - E. Spinal cord ischemia resulting in loss in LE motor function, preserved sensation, loss of urinary and fecal continence

# Question 18

- Which of the following complications should be high-on the differential diagnosis in evaluating a patient with abdominal pain soon after aortic aneurysm endovascular repair, except:
  - A. Leakage of blood in the aneurysm sac due to leakage at proximal or distal anastamotic sites
  - B. Expansion of the parent aneurysmal sac due to retrograde flow from lumbar and mesenteric arteries
  - C. Leakage of blood through the endograft material
  - D. Renal, mesenteric or iliac ischemia
  - E. Spinal cord ischemia resulting in loss in LE motor function, preserved sensation, loss of urinary and fecal continence
