

Peripheral Academic Research Consortium (PARC) Meeting

February 3rd, 2012 FDA Headquarters

Quality in the Treatment of PAD

Lesion Definitions...and other things

Thomas T. Tsai, MD, MSc
Director, Interventional Cardiology
Denver VA Medical Center
University of Colorado Denver

Outline

- Case
- Why measure quality for PVI?
- What and how to measure? The CART Model
- Future directions

Outline

- **Case**
- Why measure quality for PVI?
- What and how to measure? The CART Model
- Future directions

Peripheral Vascular Case Presentation

54 yo male with a 6 month history of **progressive bilateral lower extremity claudication**. When getting the mail (25 yards), “I have to sit on my bumper and rest before coming back to the house” (**Rutherford 3-4**)

PMHx: IDDM, CAD s/p PCI to LAD and RCA, HTN, Hyperlipidemia
Quit Tobacco 18 months ago

PE and Studies:

--BP 165/90, HR 80

--2+ bilateral CFA, bilateral nonpalpable DP and PT, monophasic

--**Right ABI 0.68 Left ABI 0.71**

--**CTA bilateral SFA occlusions**

Case

Case

TASC C-D Lesions

Type C lesions

- Multiple stenoses or occlusions totaling >15 cm with or without heavy calcification
- Recurrent stenoses or occlusions that need treatment after two endovascular interventions

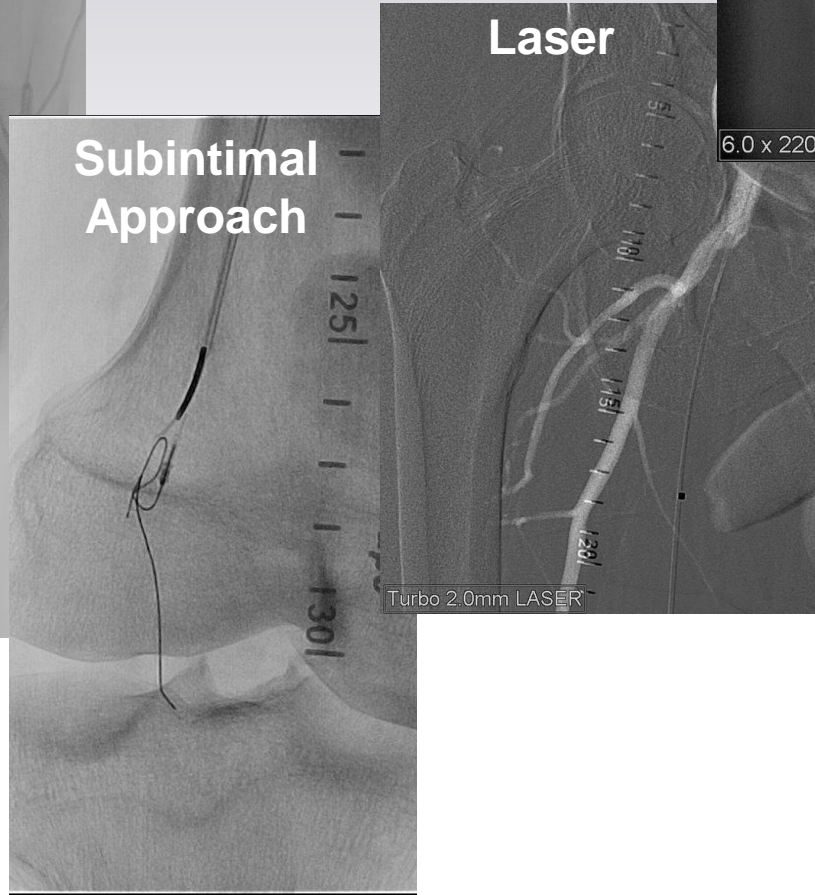

Type D lesions

- Chronic total occlusions of CFA or SFA (>20 cm, involving the popliteal artery)
- Chronic total occlusion of popliteal artery and proximal trifurcation vessels

Case

Case

How did we do?

- Same day discharge
- Technical features
 - Procedural success
 - Technical success
 - No Complications
- He's feeling great
- BUT WHAT IF.....

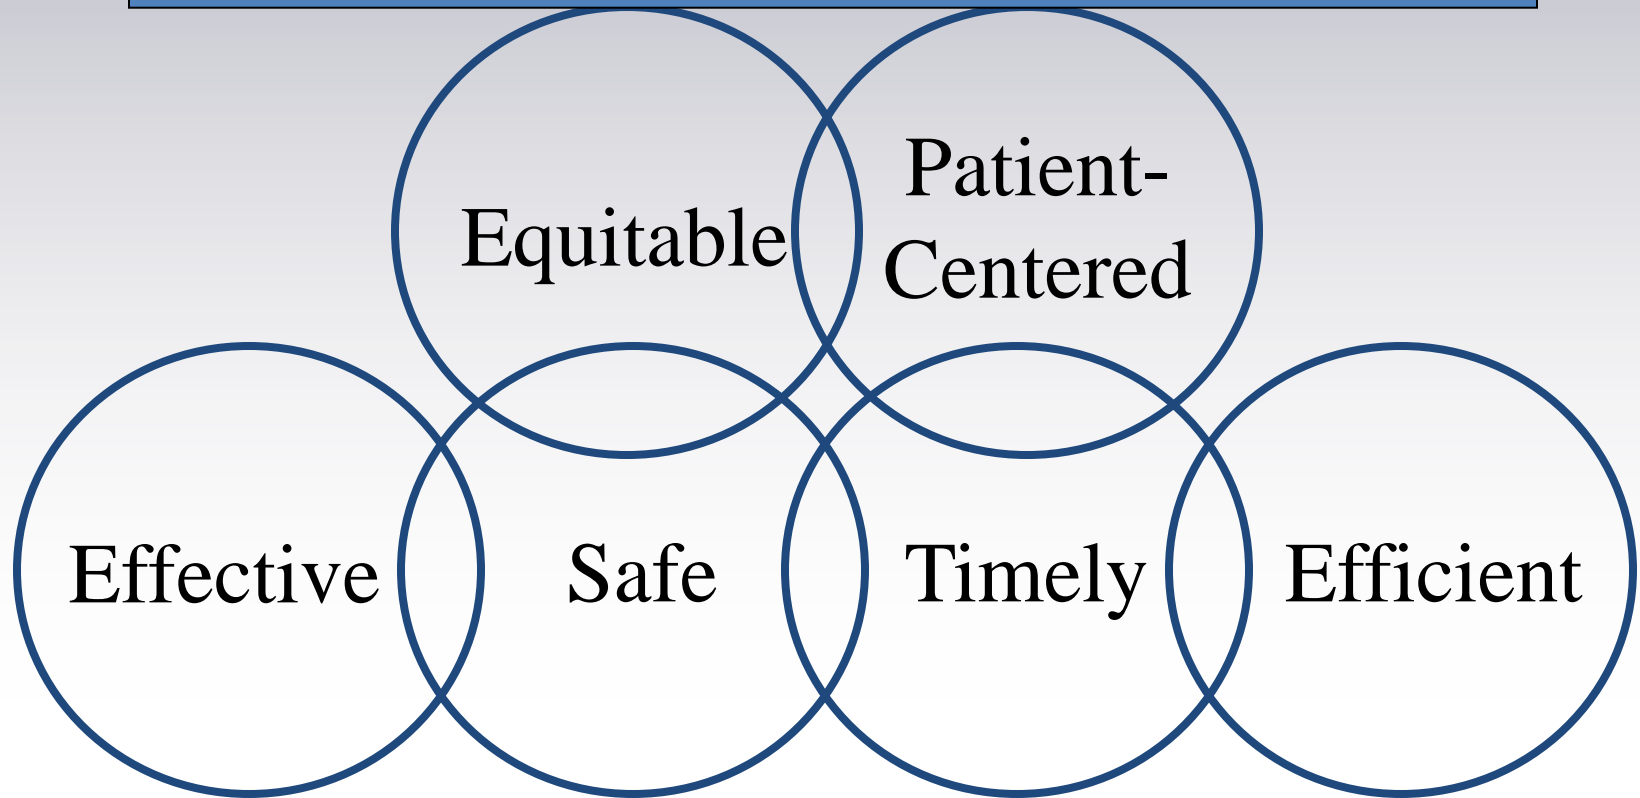

Without Measurement, Anecdotes reign Supreme!

Outline

- Case
- **Why measure quality for PVI?**
- What and how to measure?

Our Goal for the Treatment of PAD Patients

Highest Quality Health Care

Institute of Medicine. Crossing the Quality Chasm:
A New Healthcare System for the 21st Century
National Academy Press

PVI's QUALITY CHASM

Efficient

Safe

Patient
Centered

Effective

Equitable

Timely

The use of PVI for symptomatic PAD has exploded over the last decade

Anderson PL et al. *J Vasc Surg.* 2004;39(6):1200-1208

In 2012 there is very little consensus on the recommendations for PVI procedures

Classification of Recommendation

		Class I	Class IIa	Class IIb	Class III
		“Evidence and/or General Agreement beneficial, useful, effective”	“Conflicting evidence, DOO, In favor of”	“Conflicting evidence, DOO, Less well established”	“Evidence and/or General Agreement Should NOT, Harmful”
Level of Evidence	A: RCTs or Meta-analyses	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Sufficient evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/effective Some conflicting evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation’s usefulness/efficacy less well established Greater conflicting evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation that procedure or treatment not useful/effective and may be harmful Sufficient evidence from multiple randomized trials or meta-analyses
	B: RCT or non-randomized	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Limited evidence from single randomized trial or non-randomized studies 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/ effective Some conflicting evidence from single randomized trial or non-randomized studies 	<ul style="list-style-type: none"> Recommendation’s usefulness/efficacy less well established Greater conflicting evidence from single randomized trial or non-randomized studies 	<ul style="list-style-type: none"> Recommendation that procedure or treatment not useful/effective and may be harmful Limited evidence from single randomized trial or non-randomized studies
	C: Expert Opinion, Case Studies, Standard of care	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Only expert opinion, case studies, or standard-of-care 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/ effective Only diverging expert opinion, case studies, or standard-of-care 	<ul style="list-style-type: none"> Recommendation’s usefulness/efficacy less well established Only diverging expert opinion, case studies, or standard-of-care 	<ul style="list-style-type: none"> Recommendation that procedure or treatment not useful/effective and may be harmful Only expert opinion, case studies, or standard-of-care

PVI have very few Level I or IIa recommendations

ACC/AHA PCI Guidelines 2005
ACC/AHA PAD Guidelines 2006

Heterogeneous Anatomic Factors

↓ Procedural Success

1. Location
2. Occlusion vs Stenosis
3. Diffuse vs Focal Disease
4. Lesion and Vessel Calcification
5. Poor inflow or Tibial Run-off

Restenosis rates

Iliac
10%-20%

**Superficial femoral/
popliteal artery**
20%-60%

Tibioperoneal
30%-75%

“The Wild Wild West”

Too Many Cooks in the Endo Kitchen?

Recipe for Large Regional Variation

Use of PVI varied more than 14-fold across HRRs (median 12 per 10,000; 4.1 to 57.9)

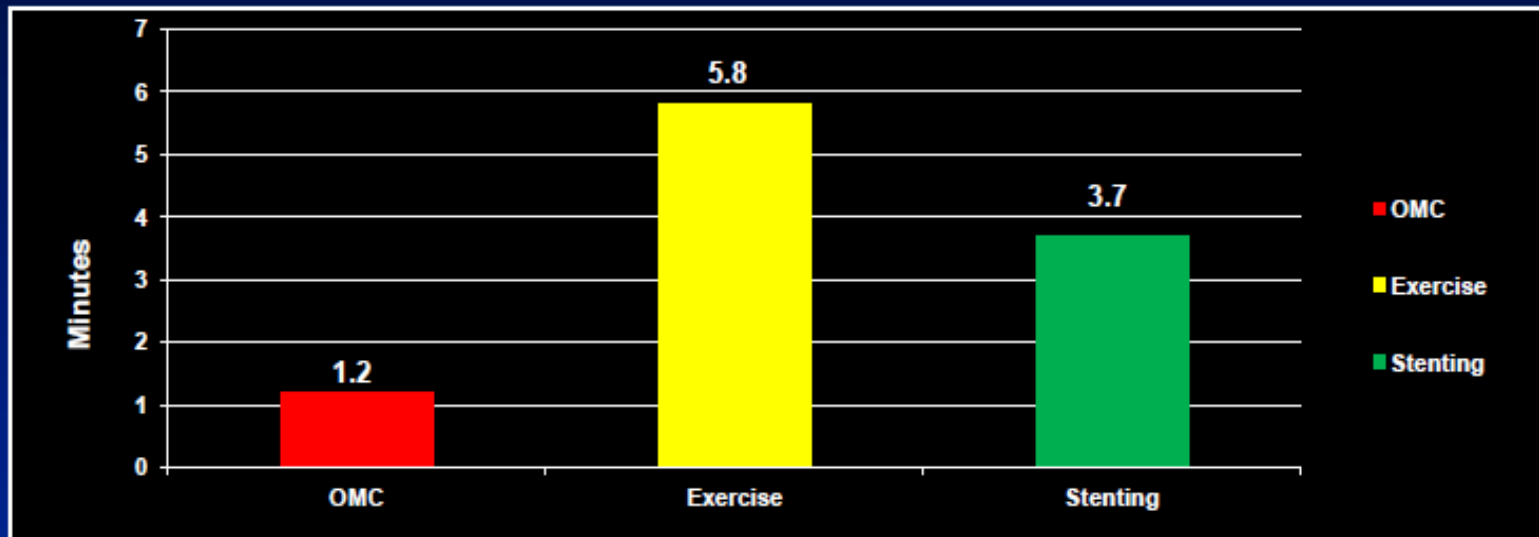

Ratio of Rates of Peripheral Arterial Angioplasty to the U.S. Average
by hospital referral region (1996)

■ 1.30 to 5.99	(66)
■ 1.10 to <1.30	(38)
■ 0.90 to <1.10	(39)
■ 0.75 to <0.90	(37)
■ 0.26 to <0.75	(112)
□ Suppressed (small numbers)	(14)
□ Not Populated	

Axelrod, DA et al. Eff Clin Prac. 2001;4:191-198

CLEVER – Primary Endpoint

Change from Baseline to Six (6) Months

Pair-Wise Comparisons

	Difference (minutes)	P Value
Exercise vs. OMC	4.6 (95% CI, 2.7-6.5)	<0.001
Stenting vs. OMC	2.5 (95% CI, 0.6-4.4)	0.02
Exercise vs. Stenting	2.1 (95% CI, 0.0-4.2)	0.04

CLEVER – Secondary Endpoints

Walking Impairment Questionnaire

Change from Baseline to Six (6) Months

	P Value	P Value	P Value	P Value
SE vs. OMC	0.25	0.007	0.007	0.07
ST vs. OMC	<0.001	<0.001	<0.001	0.05
ST vs. SE	0.01	0.03	0.007	0.53

Peripheral Artery Questionnaire

Change from Baseline to Six (6) Months

	P Value	P Value	P Value	P Value
SE vs. OMC	0.03	0.02	0.02	0.03
ST vs. OMC	<0.001	<0.001	0.001	<0.001
ST vs. SE	0.04	0.001	0.16	0.005

Key Data Elements and Definitions for Peripheral Atherosclerotic Vascular Disease

A Report of the American College of Cardiology Foundation/
American Heart Association Task Force on Clinical Data Standards
(Writing Committee to Develop Clinical Data Standards for
Peripheral Atherosclerotic Vascular Disease)

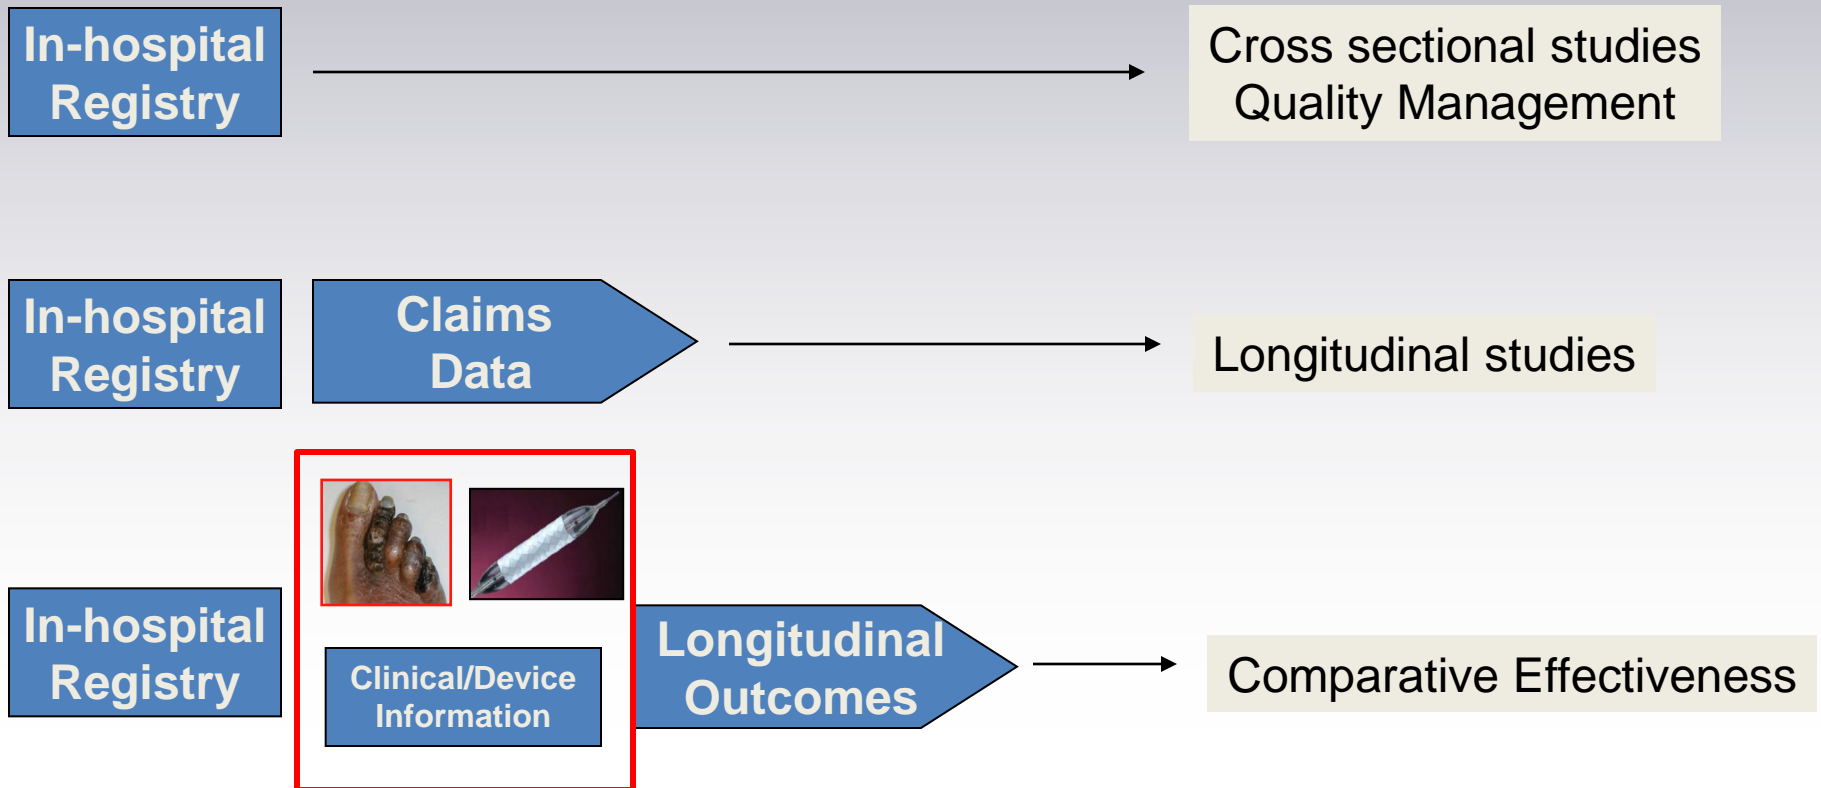

Show Me Some DATA!

Defining the “Key Data Elements” that best characterize PAD patients and their treatments

Patient Factors	Indications, sidedness, severity of presentation, ankle brachial index
Procedural Factors	Access site, catheter size, antegrade vs. retrograde, vessel location, segment, highest stenosis, length, diameter, restenosis, in-stent restenosis, post stenosis, bifurcation, previously treated, recanalization, device diameter, device length, device success, adjunct tools, procedural success
Complications	Dissection, embolus, thrombosis, abrupt closure, vessel perforation requiring treatment, vascular complication, emergent vascular surgery

Quality Improvement

Clinical/Device
Information

The screenshot displays a medical software interface. On the left is the 'PAD Main Chart Review form' with a search bar for 'Study ID' (01) and 'Procedure Date'. It includes tabs for 'Presentation', 'History', 'Tests', 'Diag Angi', 'PVI', 'Surgery', 'Comp/Disc', and 'Admin'. The 'Tests' section has checkboxes for 'ABI', 'Exercise ABI', and 'Toe Brachial Index', with input fields for 'Right' and 'Left' values (e.g., 0.96, 0.73) and 'Toe Pressure' in mmHg. Below are sections for 'Most Recent Duplex Ultrasound', 'Most Recent CT', and 'Most Recent MRA', each with dropdown menus for 'Side' and 'Location'. On the right is the 'Diagnostic Angiography Diagram' showing a schematic of the right lower extremity arterial system. It labels various vessels: Distal Aorta, R CIA, R EIA, R CFA, R PFA, R SFA, R Pop, R AT, R Peroneal, R IIA, R IA, R TP Trunk, R I, and PT. A 'Surgical Bypasses' menu lists options like AFA, PPO, AXF, FTA, and FF. Inflow and runoff options are also present.

So what lesion elements will be in a transaction clinical application ?

Data Elements and Definitions

B	C	M	N
element name	Definition	Keep?	Selections
Characteristics: Normal	Indicate if the vessel is normal without stenosis or vessel abnormalities	yes	yes/no
Heavy Calcium	Indicate if moderate or heavy calcium is present in the vessel segment	maybe	yes/no
Chronic Total Occlusion	Indicate if the segment with 100% pre-procedural stenosis was presumed to be 100% occluded for at least 3 months previous to this procedure and not related to a clinical event prompting (or leading) this procedure (CathPCI 4.0).	yes	yes/no
Thrombus	Indicate if thrombus is present as assessed by baseline angiography and suggested by certain angiographic features: haziness, reduced contrast density or contrast persistence, irregular lesion contours, or globular filling defects (CathPCI4.0)	maybe	yes/no
Eccentric	Indicate if an eccentric plaque is present defined as a stenosis noted to have one of its luminal edges in the outer one quarter of the apparently normal lumen	no	yes/no
Luminal Irregularities	Indicate if luminal irregularities are present defined as irregularities in the vessel lumen <30% in stenosis in the vessel	no	yes/no
Diffusely diseased	Indicate if the vessel segment is diffusely diseased defined as > half of the segment length and >30% stenosis	no	yes/no
In-Stent Restenosis	Indicate if the lesion is within a previously placed stent. In-stent restenosis is defined as a previously stented lesion that has 50% or greater stenosis	no	yes/no
In-Stent Thrombosis	Indicate if the previously stented lesion shows the presence of thrombus in the stent	no	yes/no
Restenosis	Indicate if restenosis is within a previously angioplastied site. Balloon angioplasty restenosis is defined as a previously angioplastied lesion that has 50% or greater stenosis	no	yes/no
Adjunct Tools	Indicate which adjunctive tools are used		
	Translesional gradient	maybe	
	Intravascular Ultrasound (IVUS)	maybe	
Translesional Gradient	Indicate if a translesional was performed to consider lesion significance	maybe	yes/no
	Indicate the translesional gradient	maybe	
Intravascular Ultrasound	Indicate if intravascular ultrasound was performed to confirm stenosis or lesion	maybe	yes/no

The Clinical Model

- 
- Designed by the users
 - Standards-based
 - Integrated in CPRS
 - Faster than dictation
 - Improves efficiency
 - Part of workflow

- What and how to measure? The CART Model
- **Future directions**

Synergy and Harmonization

NCDR Integrated Interventional Platform Workgroup

- Develop an integrated IT platform to integrate the NCDR CathPCI, CARE, and PVI data elements into a new integrated interventional procedure platform of the NCDR

CathPCI Registry

For diagnostic cardiac catheterizations and percutaneous coronary interventions

CARE Registry

For carotid artery revascularization and endarterectomy procedures

NCDR[®] PVI Registry[®]

Conclusions

- Harmonize and synergize data elements and definitions for peripheral vascular interventions
 - Apples to apples comparisons
 - Audit, benchmark and feedback
- Quality metrics and Performance measures
- Harmonized for greener pastures

Questions and Discussion

Thank You!
Thomas.Tsai@va.gov

The Six Aims for Improving The Delivery and Quality of Care

Safe

Avoiding complications, reducing errors

Effective

Services based on scientific evidence

Patient
Centered

Respectful and responsive to individuals

Efficient

Does not waste resources

Timely

Decreasing wait times, improving flow

Equitable

Consistent care regardless of patient characteristics and demographics

Quality Metrics, Performance Measures, etc.

Definitions

•Quality Metrics

- Measures that have been developed to support self-assessment and quality improvement (QI) at the provider, hospital , and/or healthcare system level
- AKA “test, quality, preliminary, candidate, test, evolving” measures,

•Performance Measures

- Process, structure, efficiency, or outcome measures that have been developed using ACC/AHA methodology, including the process of public comment and peer review. External reporting.
