Stent vs. Non-Stent strategies for Peripheral Interventions

***Dallas Cardiovascular Innovations* 2015**

Nicolas W Shammas, MD, MS, FACC, FSCAI
President and Research Director,
Midwest Cardiovascular Research Foundation
Adjunct Clinical Associate Professor of Medicine,
University of Iowa Hospitals and Clinics
Consultant and Interventional Cardiologist
Cardiovascular Medicine, PC

Dr. Nicolas Shammas receives relevant educational and research grants from Covidien, Boston Scientific, CSI, Spectranetics, Cordis, Medtronic, Abbott and Bard. Full disclosure at www.mcrfmd.com

What is the Strategy in Question?

Stent vs no stent strategy?

STENT STRATEGY:

- Primary stenting
  - BMS
  - DES-nonpolymer based
  - DES-polymer based*
  - DES-bioabsorbable scaffolds*

*Not available.

Non Stent Strategy:
(Provisional stenting strategy)

After POBA
After DCB
After Atherectomy+ adjunctive POBA
After Atherectomy + adjunctive DCB
After Scoring + Adjunctive DCB
After Chocolate + Adjunctive DCB

After Drug Coated Scoring balloons*
After Drug Coated Chocolate balloon*
* not available

Current Device Application in Treating FP lesions

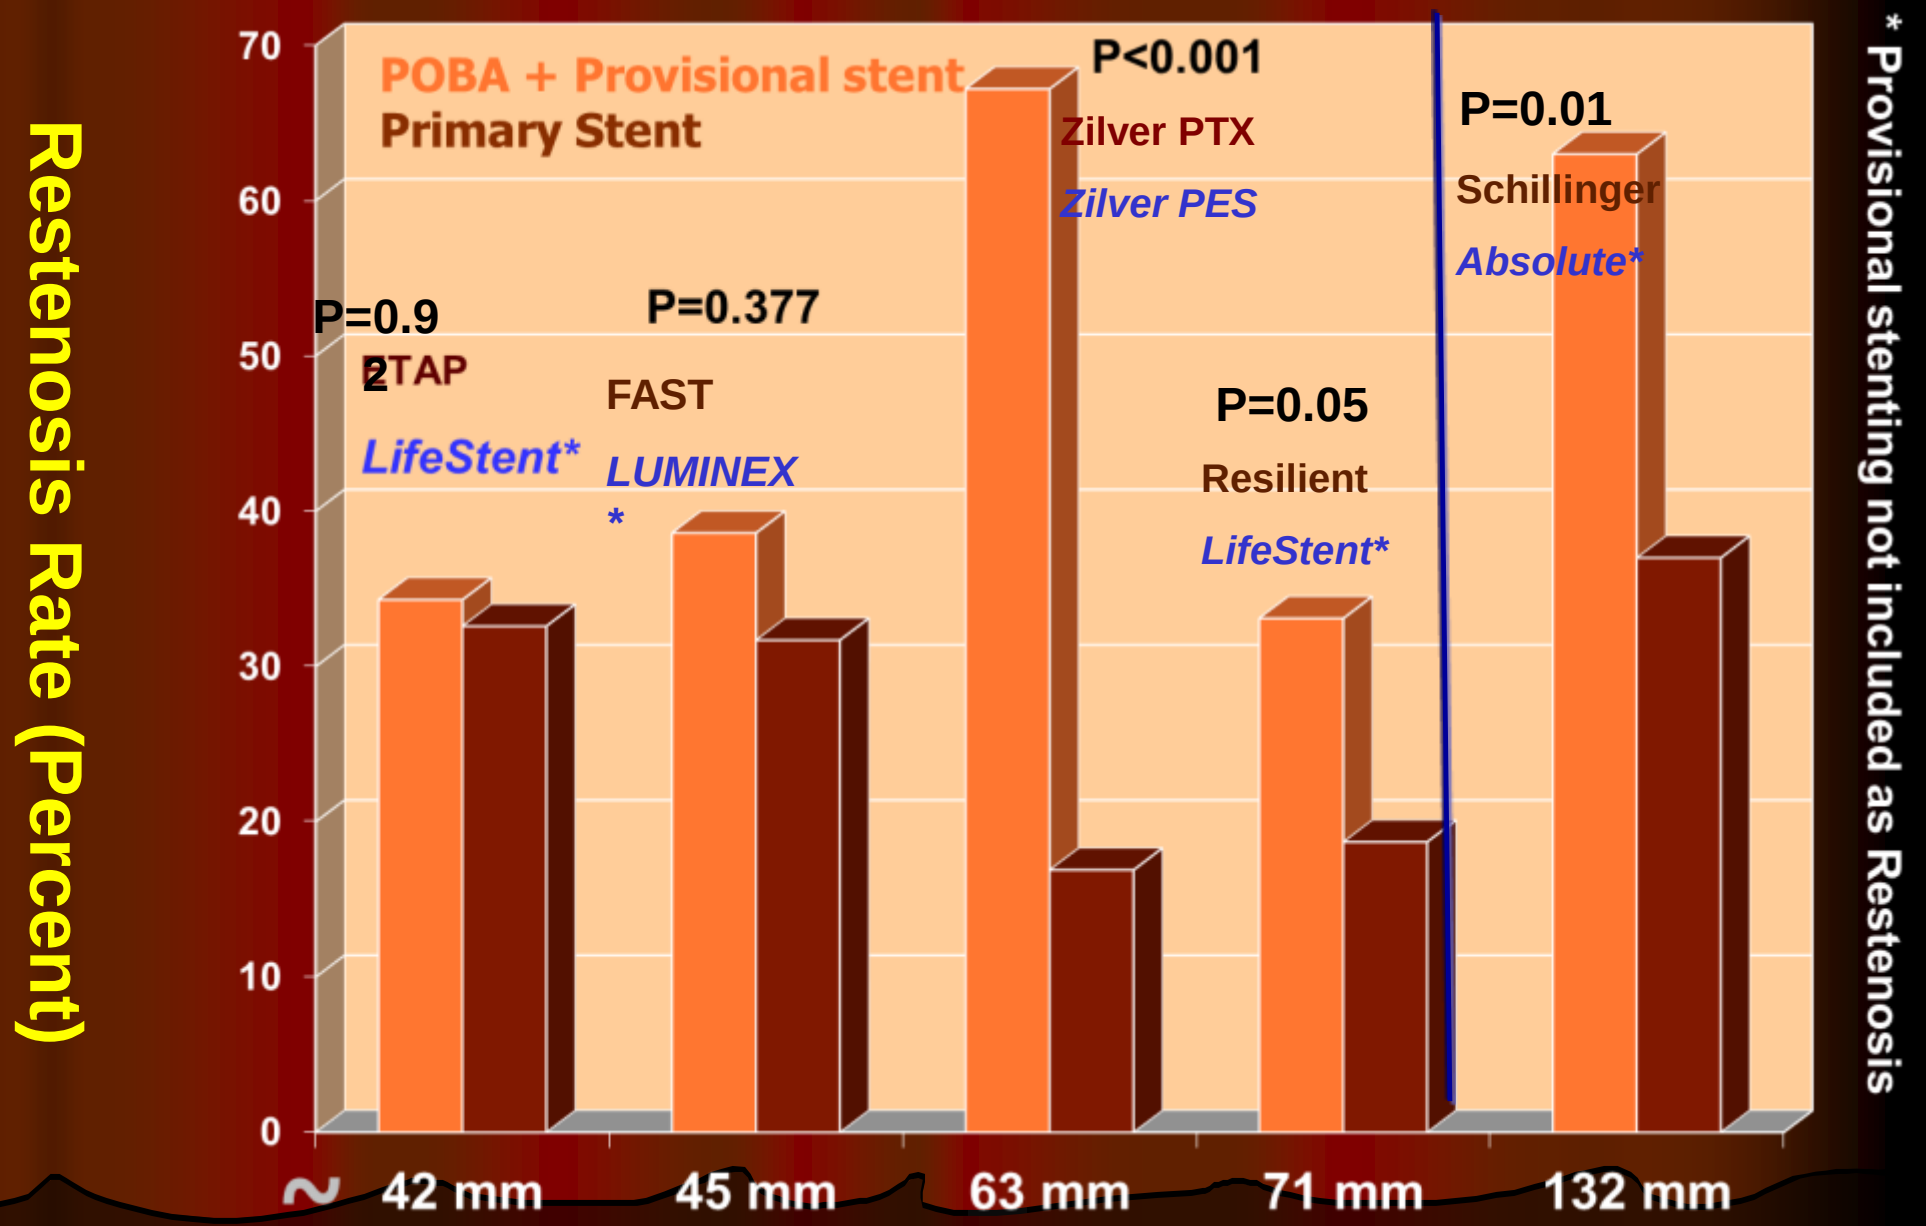
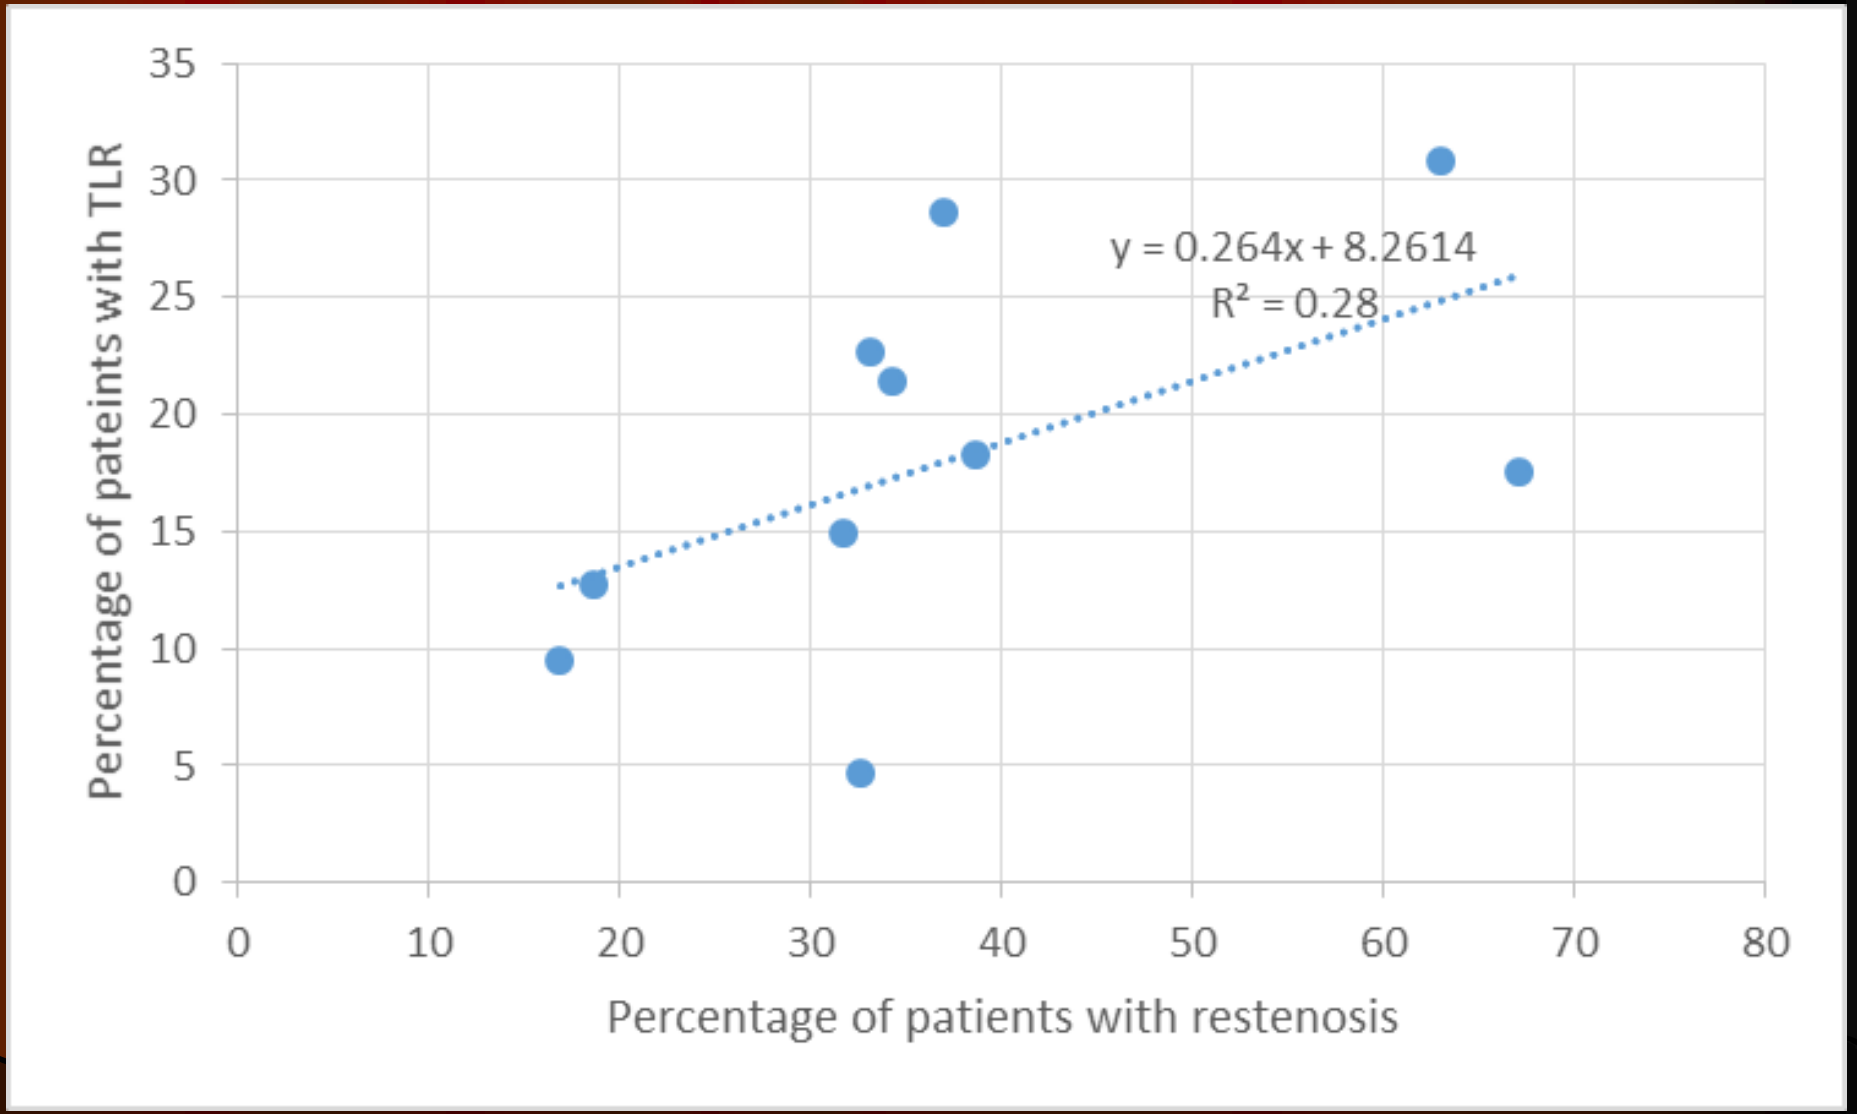
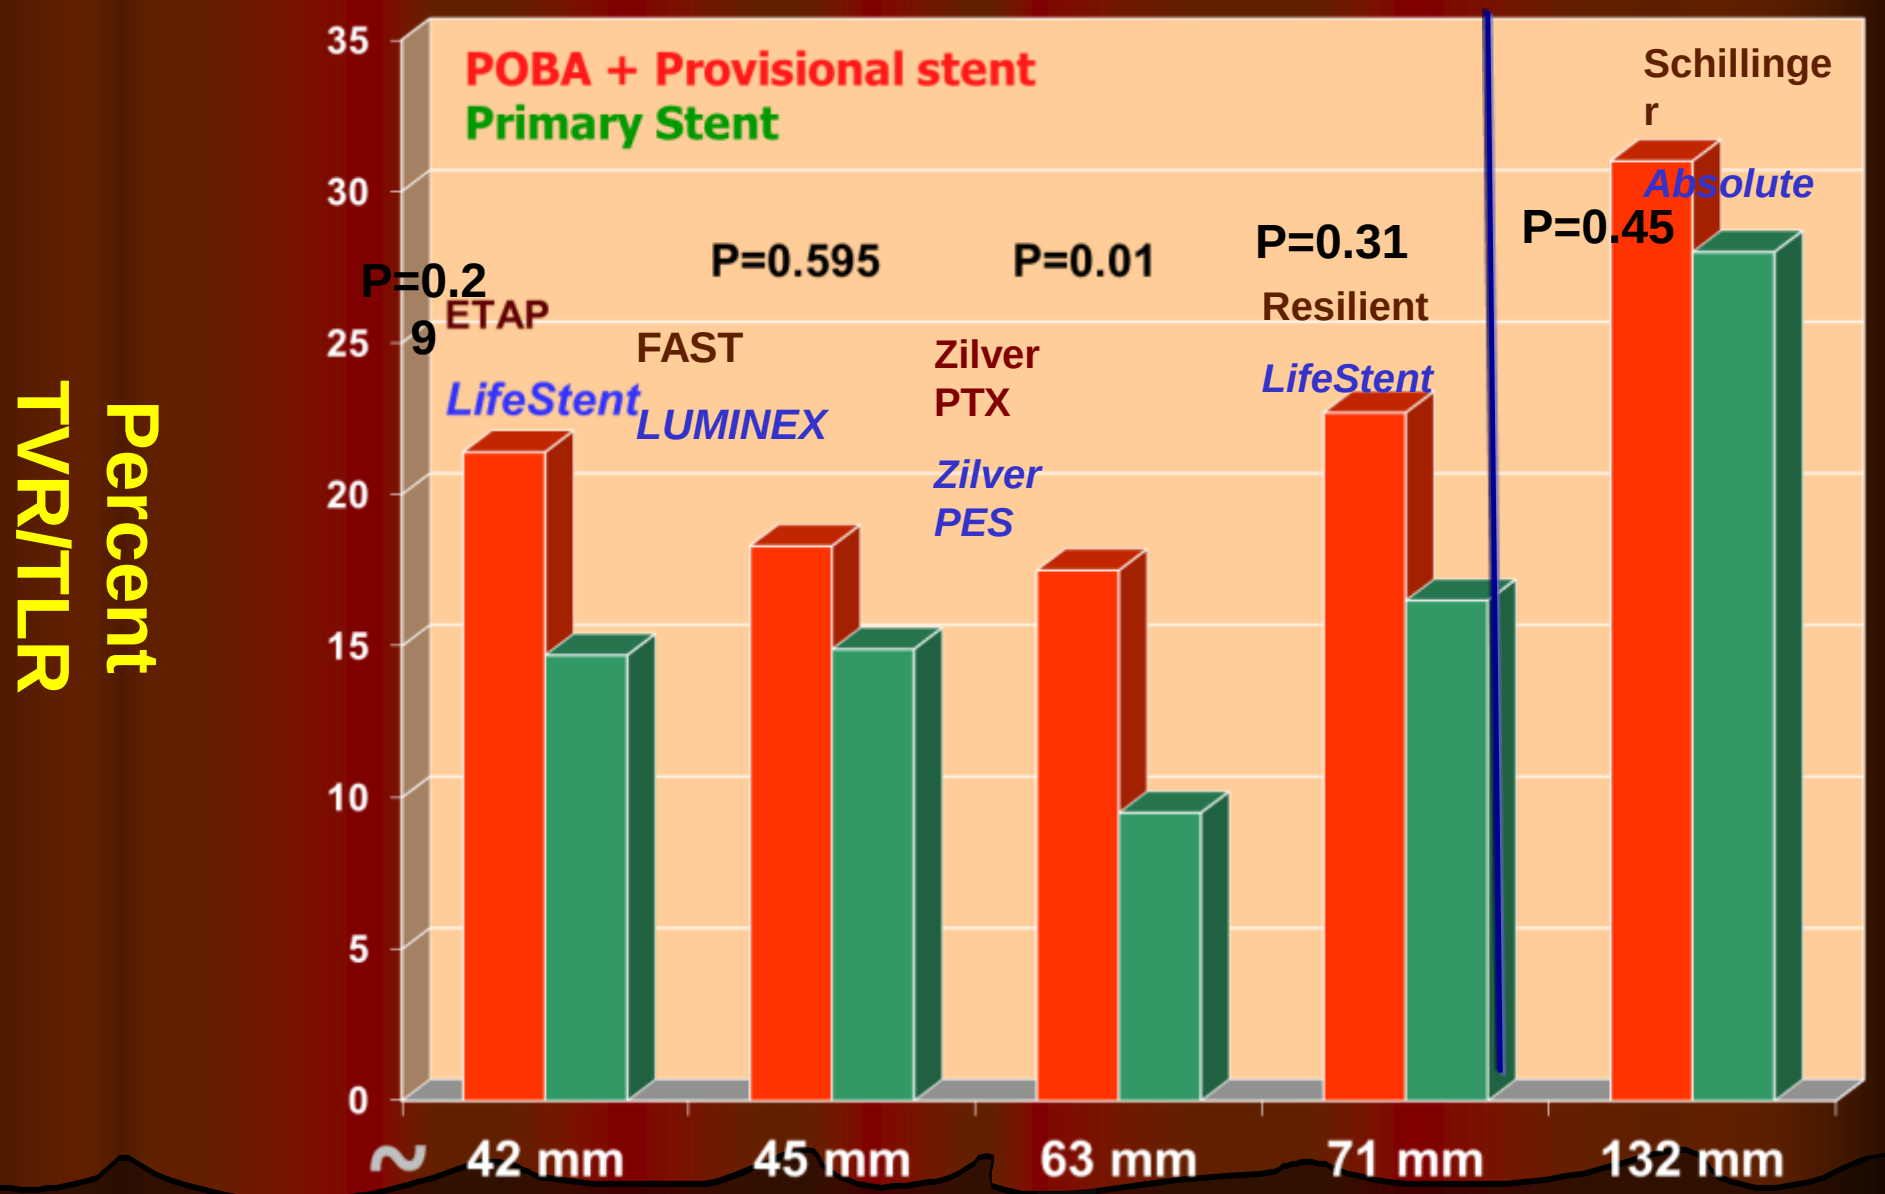
One-Year Restenosis Rate in Randomized Femoropopliteal trials



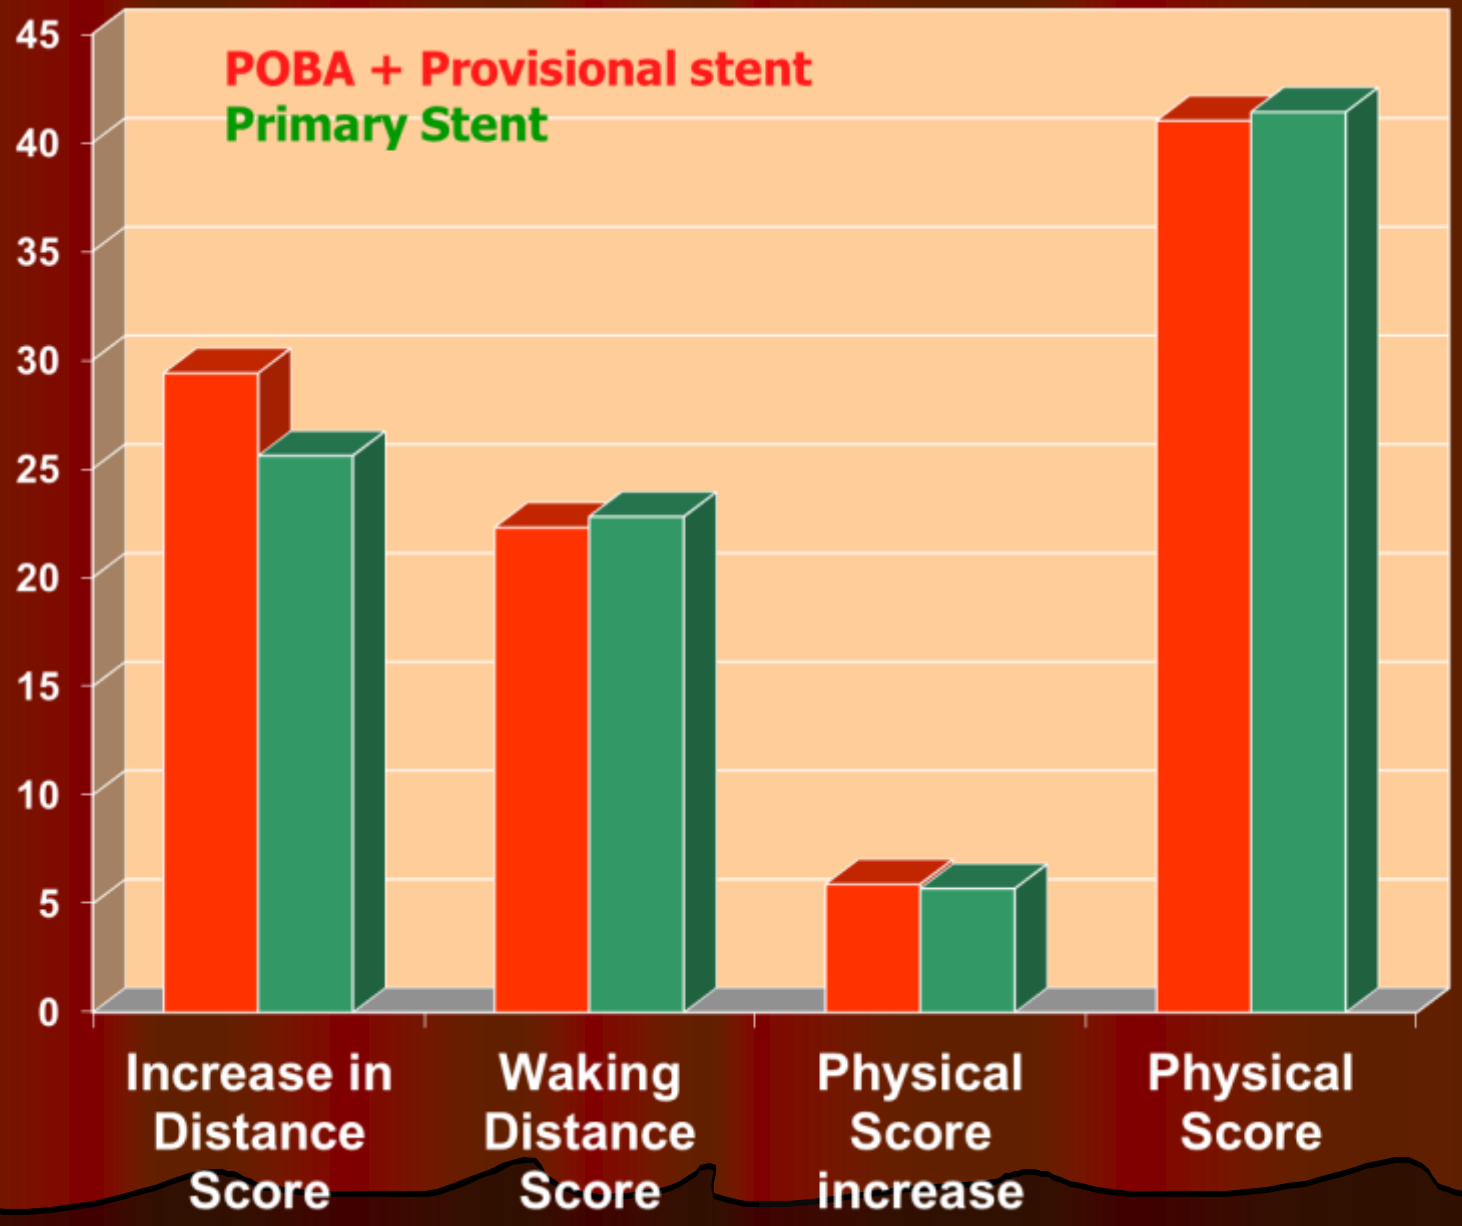
Restenosis rate vs TLR rate



One-Year TLR/TVR in Randomized Femoropopliteal trials



RESILIENT Trial QOL and walking scores (Stent vs Provisional Stent)



Clinical Outcomes and Posttreatment Clinical Benefit Index Results

Measurement	PTA Group		DES Group	
	Baseline	12 Months	Baseline	12 Months
ABI	0.68±0.2	0.89±0.20*	0.67±0.2	0.91±0.23*
Rutherford classification,† % of patients				
0	0%	45.4%	0%	44.7%
1	0.8%	21.7%	0.9%	20.9%
2	46.2%	20.3%	52.5%	23.3%
3	44.5%	10.1%	37.7%	9.2%
4	4.7%	1%	5.9%	1.9%
5	3.4%	1.5%	3%	0%
6	0.4%	0%	0%	0%
Walking scores, maximum possible=100%‡				
Walking distance	26.3±28.6%	57.7±36.9%*	25.0±27.6%	57.8±37.9%*
Walking speed	29.7±30.3%	58.2±35.7%*	27.5±27.1%	55.7±37.1%*
Climbing	38.7±32.5%	61.5±34.0%*	35.9±32.2%	55.6±37.3%*
Sustained posttreatment clinical benefit index,§ % of patients	N/A	75.8%	N/A	88.3%?

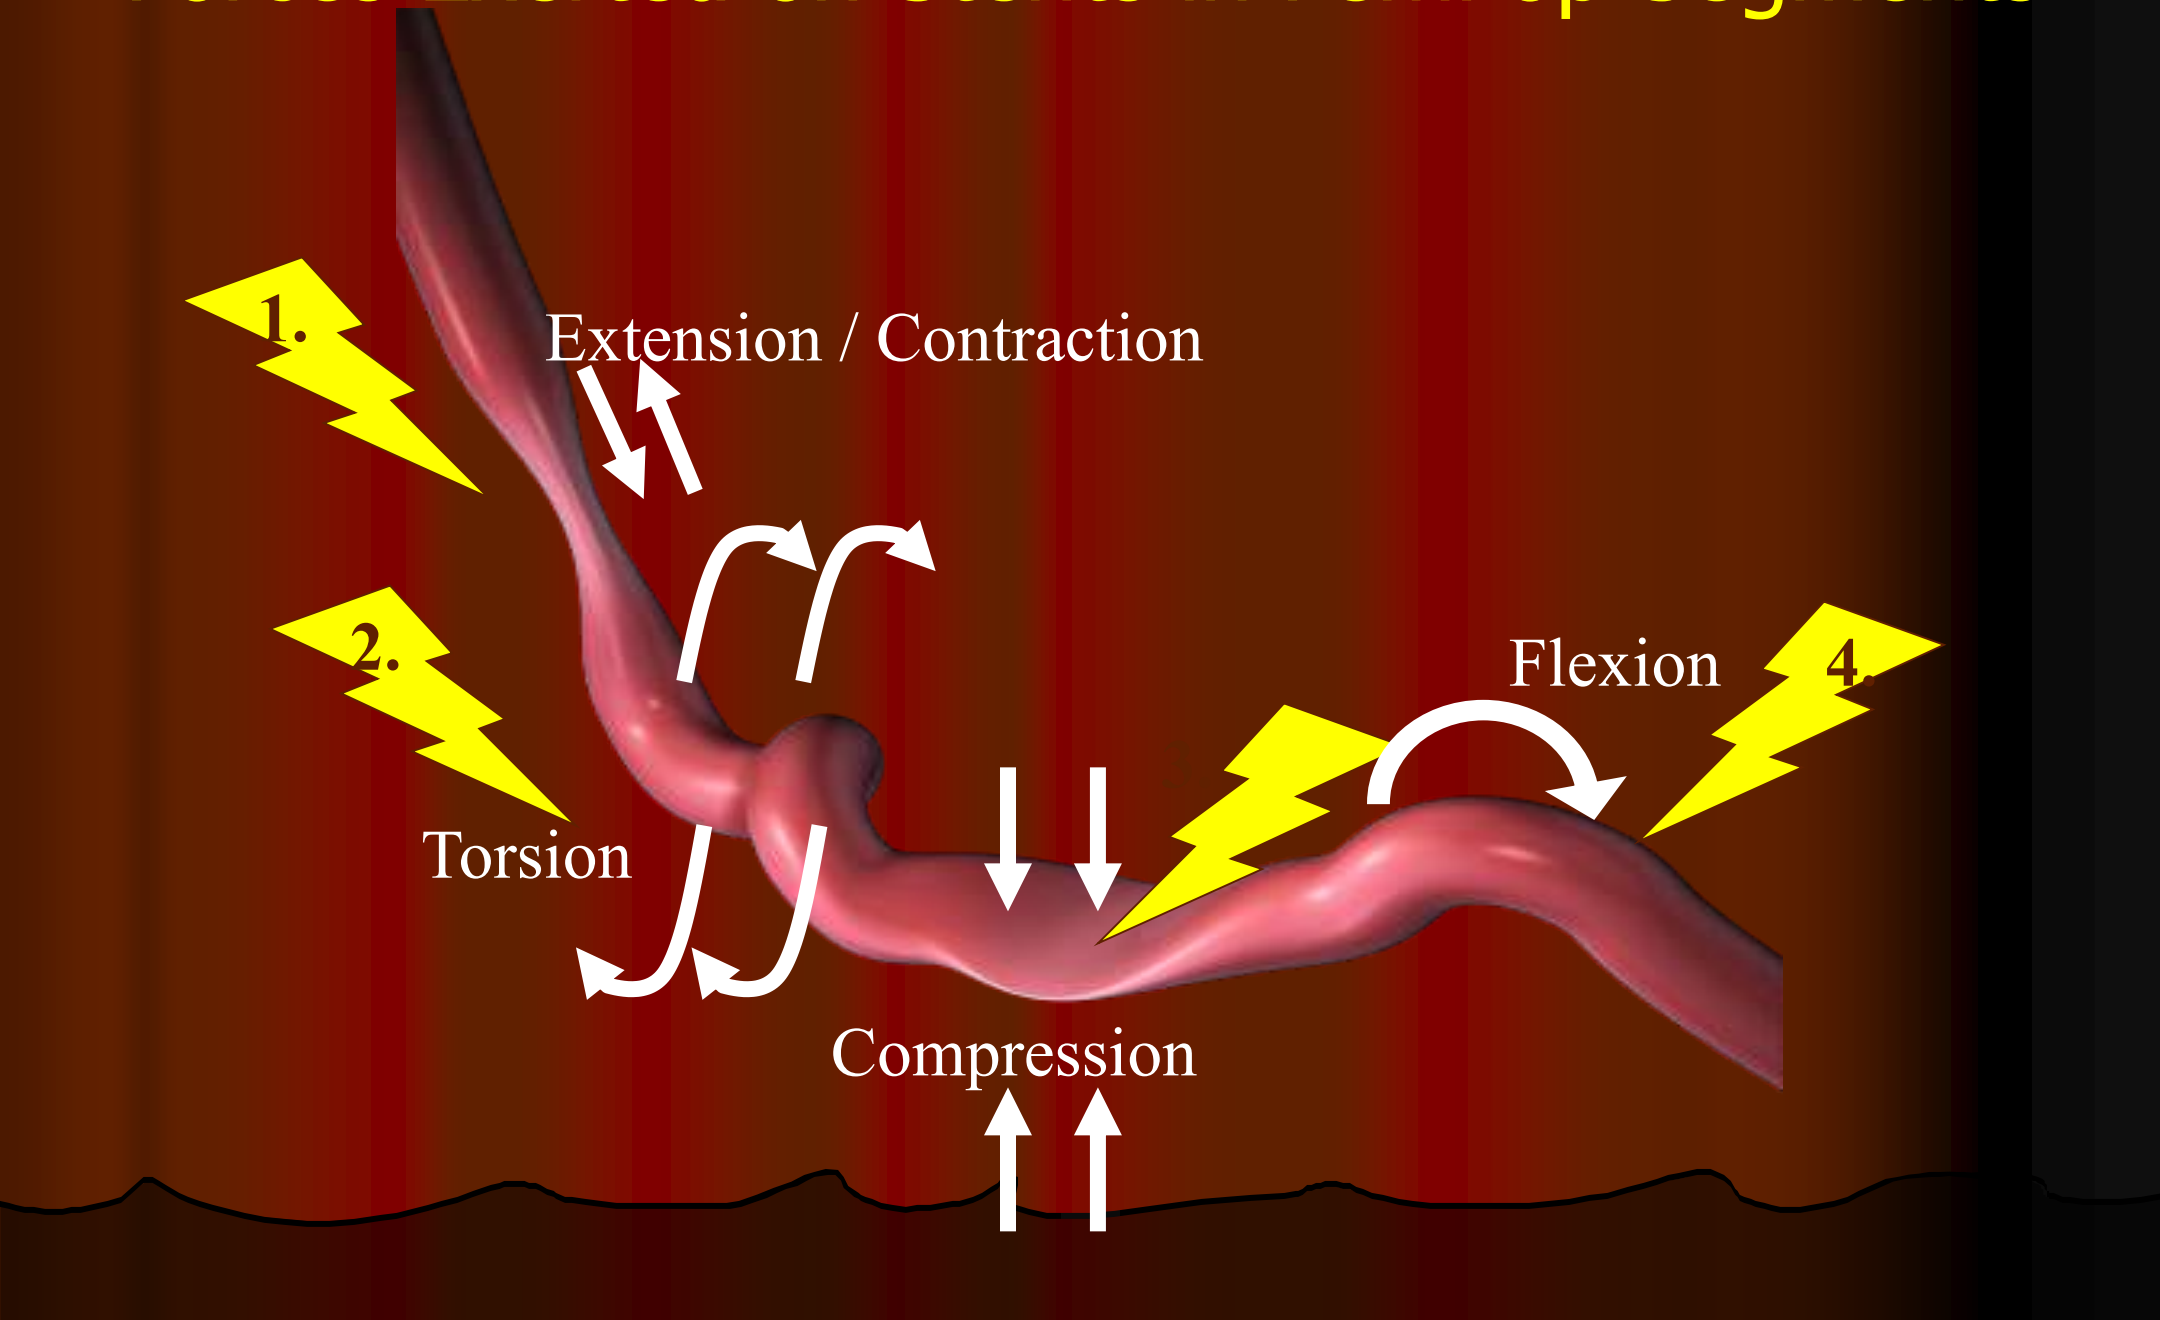
? § Posttreatment clinical benefit was defined as freedom from persistent or worsening claudication, rest pain, ulcer, or tissue loss after the initial study treatment.

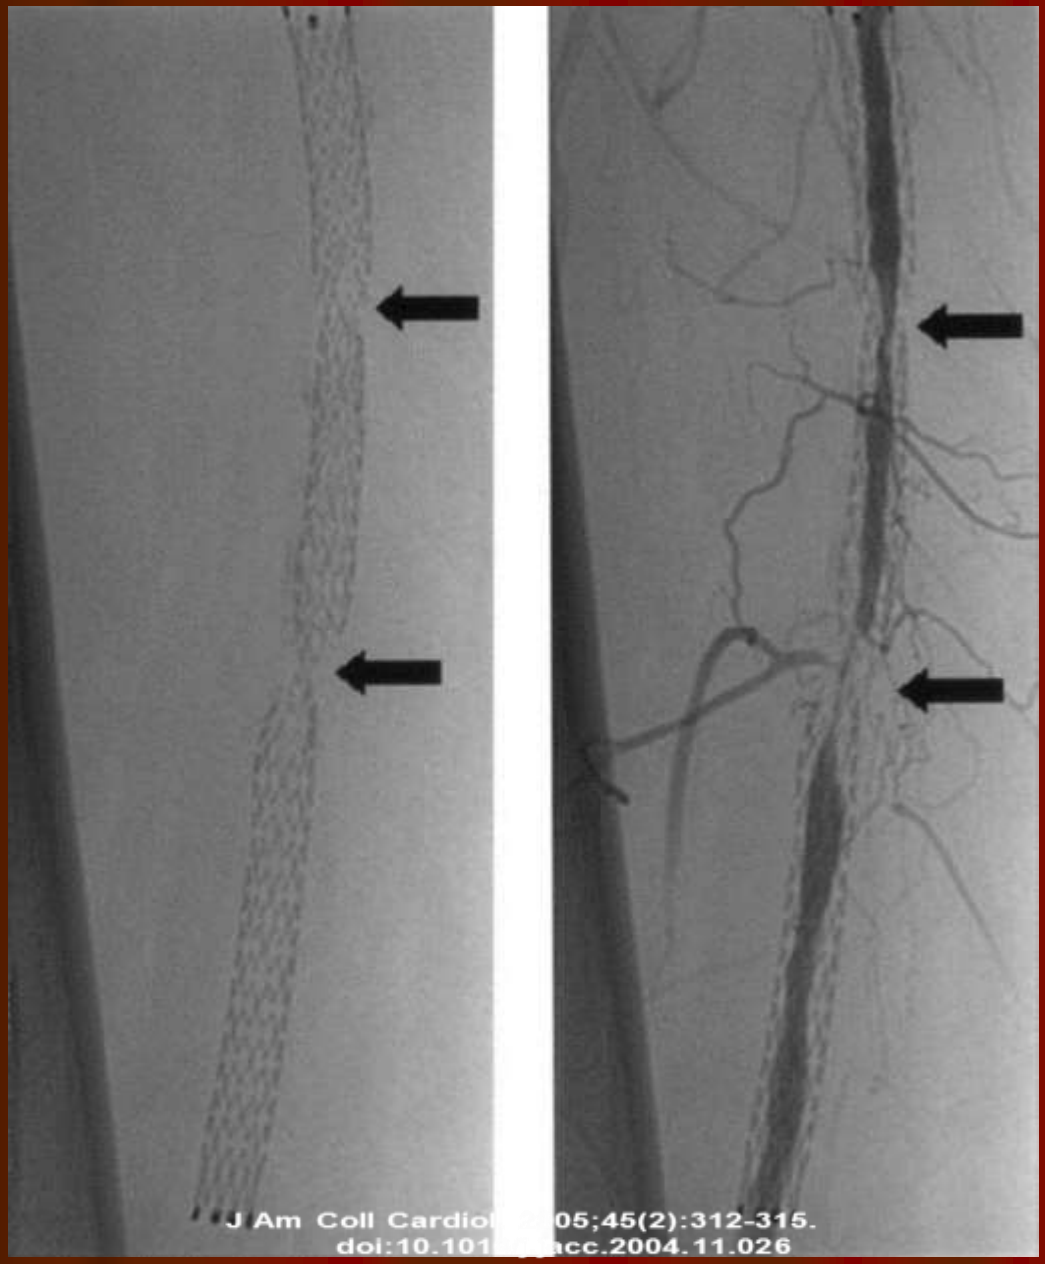
? ? $P<0.001$ compared with PTA group; paired t test.

Revisit what is important…

- Is Patency the endpoint that should be guiding our clinical trials?
- OR should we think about TLR/TVR and QOL as the ultimate goal???
- "**Déjà vu**" questions from coronary trials:
  - Coronary Trial has now clinical outcome endpoints before angiographic endpoints
  - Avoiding the "Occulo-stenotic reflex"
  - Patency or TLF? TLF for PAD=Vasc Death, Amputation and TLR

Forces Exerted on Stents in FemPop Segments





ISR treatment

- Long diffuse lesions
- High rate of embolizations
- Restenotic-thrombotic lesions
- Recurs very frequently
- No good way to treat it effectively
- More layers of stents may be needed
- Fracture rate 1-3% in newer generation stents
- May impede effectiveness of upcoming anti-restenotic treatment
- My impair future surgical targets

Stenting the FemPop Segment: Facts from Randomized Trials

- Stenting has lower restenosis at 1 year than PTA particularly in longer lesions . Longer lesions have a high rate of restenosis with both PTA and stent
- No difference in TLR with primary stenting vs provisional stenting using BMS
- Primary DES or provisional DES has lower TLR than PTA or PTA with provisional BMS stenting. Randomized data available for shorter lesions
- QOL, Walking distance, claudication are not consistently altered at 1 year by primary stenting vs provisional stenting
- FP stenting has its inherent problems relating to the nature of ISR lesions and stent fractures

How to avoid stent related problems?

Avoid Routine Primary Stenting

Consider Stenting :

- Provisional preferably with DES
- DES in Short lesions in proximal to mid SFA
- DES Stenting in advanced limb ischemia when feasible to maximize chance for wound healing
- Otherwise: our strategy is to reduce stenting and add adjunctive DCB

Optimal Strategy in Peripheral Arterial Revascularization

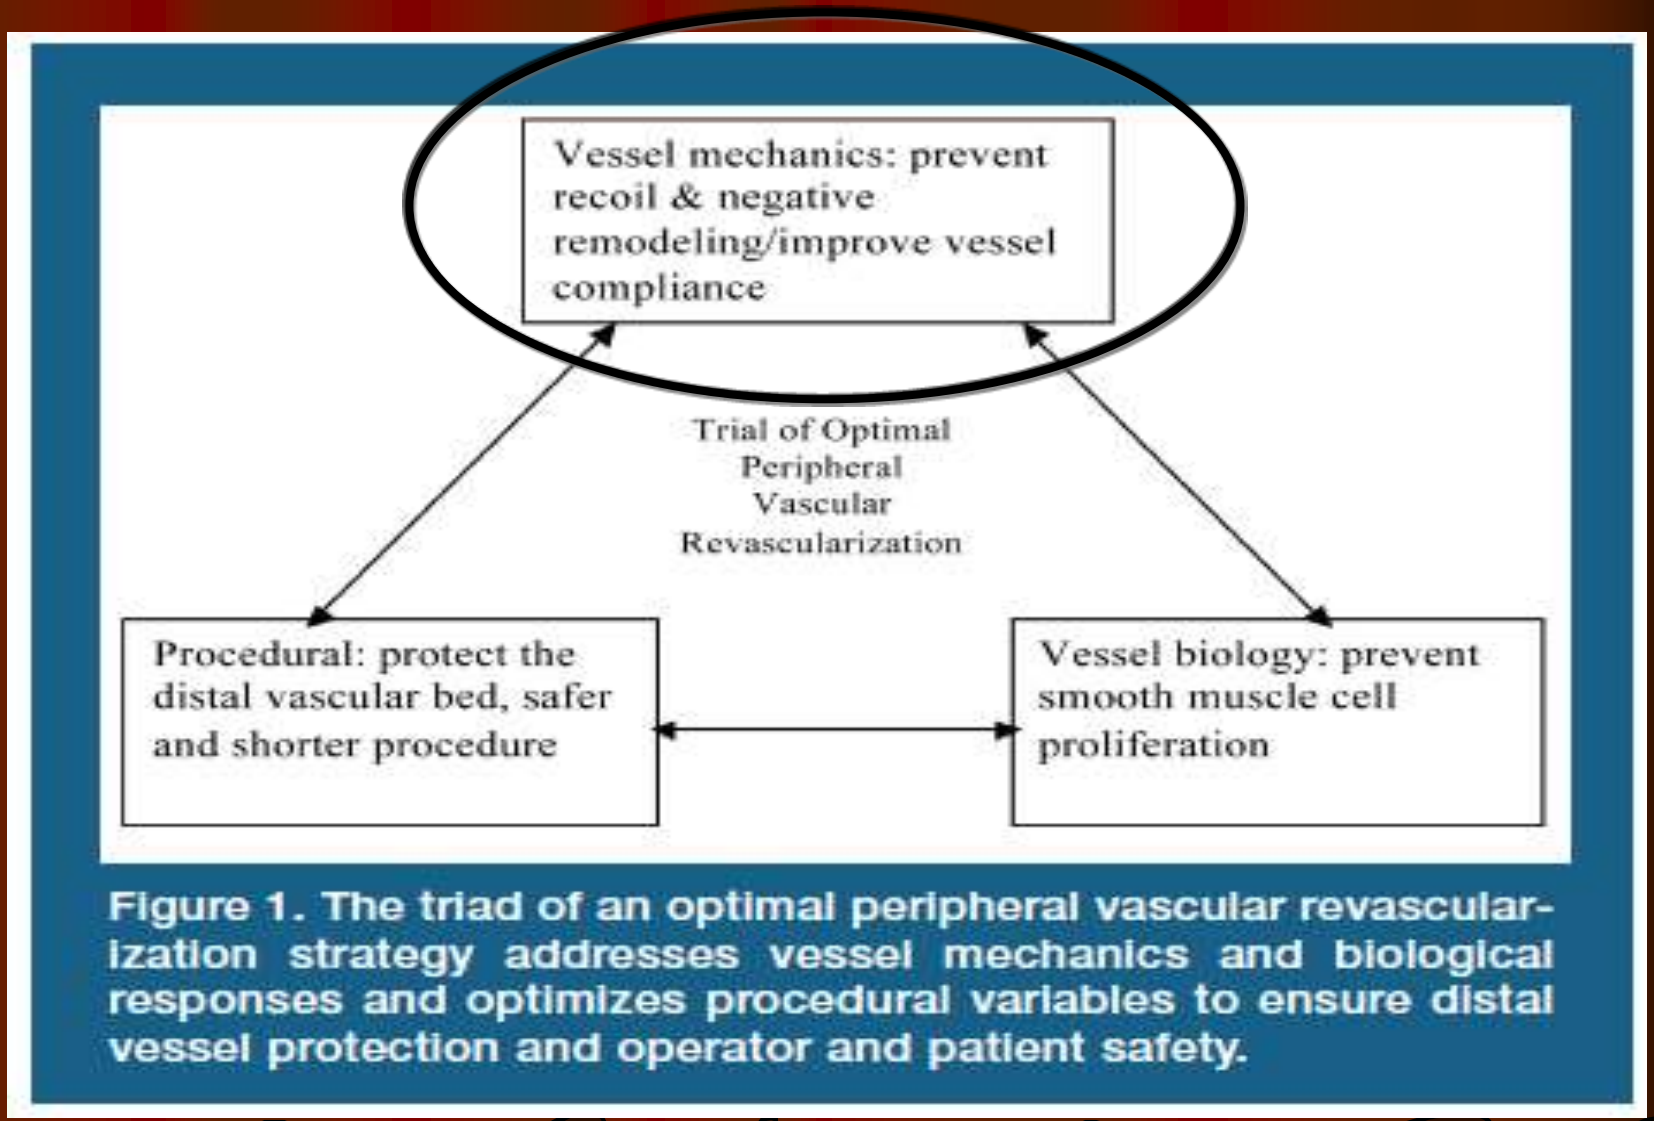


Figure 1. The triad of an optimal peripheral vascular revascularization strategy addresses vessel mechanics and biological responses and optimizes procedural variables to ensure distal vessel protection and operator and patient safety.

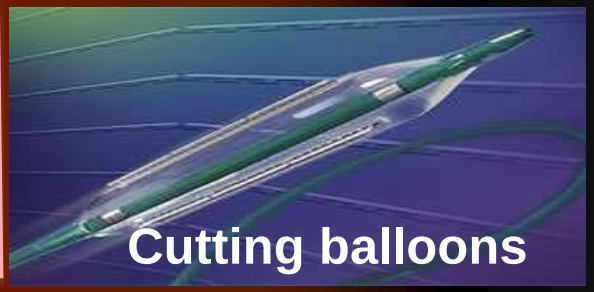
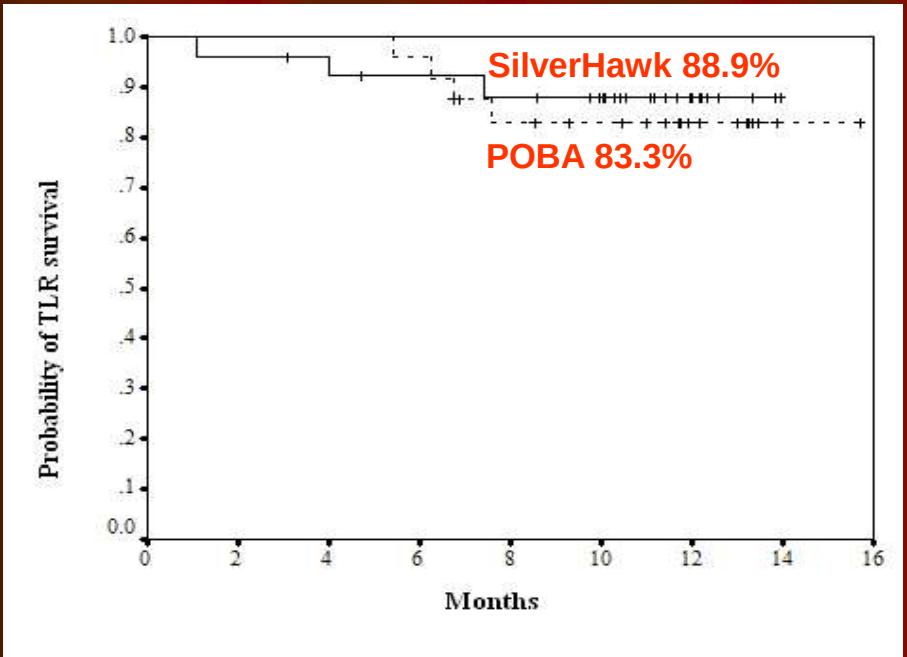
Shammas NW, Vascular Disease Management, 2009;6:36-40

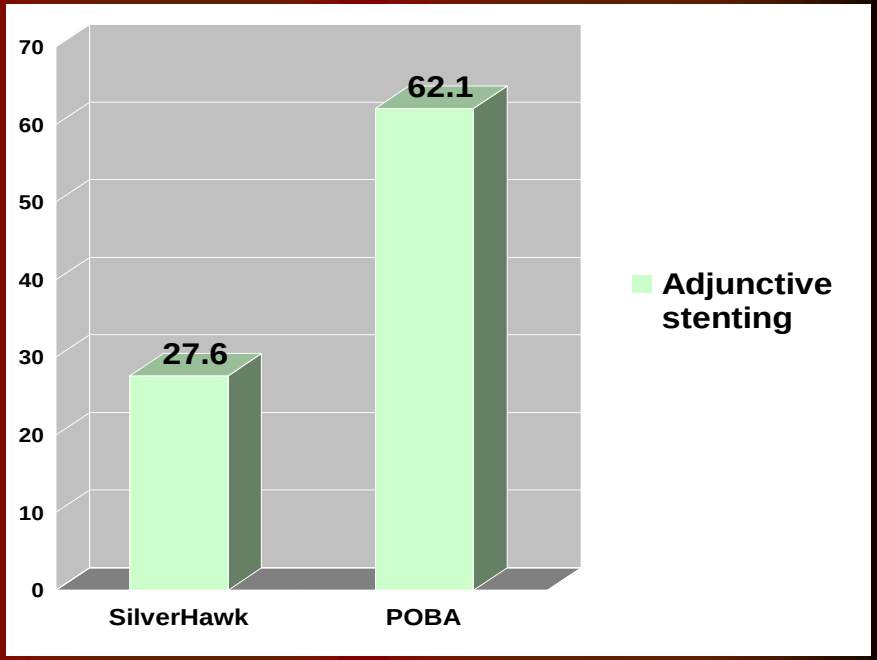
Atherectomy Devices

Specialized Balloon



Angioplasty versus SilverHawk Atherectomy





1. No change in TLR
2. Reduction in stenting by > 50%
3. Very high rate of distal embolization

distal macroembolization in 64.7% treated with atherectomy versus none of 10 in the PTA group (P < .001).

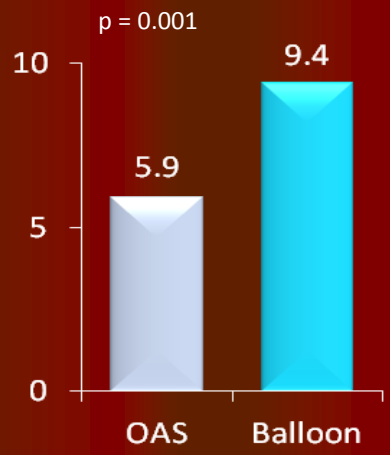
Shammas et al. J Vasc Interv Radiol. 2011; 22(9):1223-8. Epub 2011 Jul 14.

CALCIUM 360° STUDY
OAS Outperforms Balloon Angioplasty in BTK Lesions

- Prospective, multi-center
- Randomized
- 95% severe and moderate calcium
- Below the Knee lesions

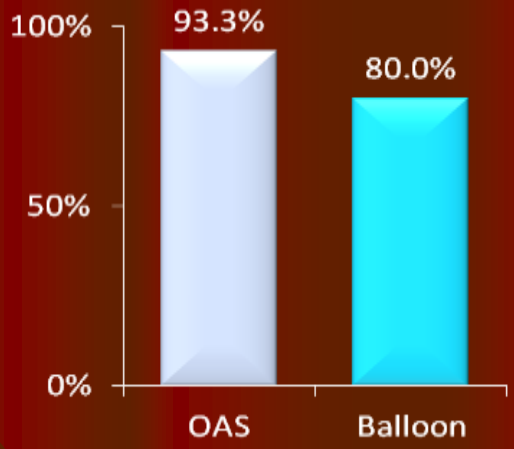
Max Balloon Pressure

Average Max Balloon Pressure (atm)

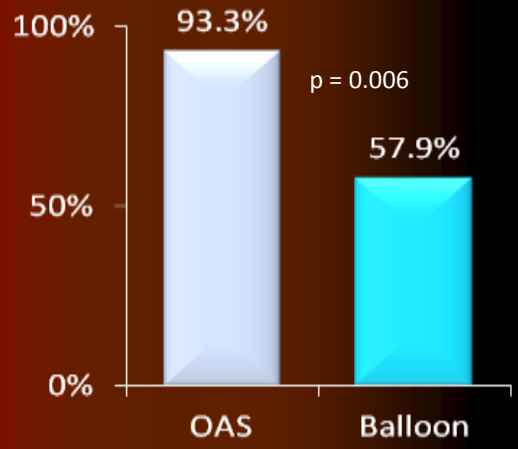


Results at 12 Months

Freedom From Restenosis



Freedom From Major Adverse Events*



Shammas, N. *J Endovascular Ther*, 2012; 19:480-488.

Slide courtesy CSI

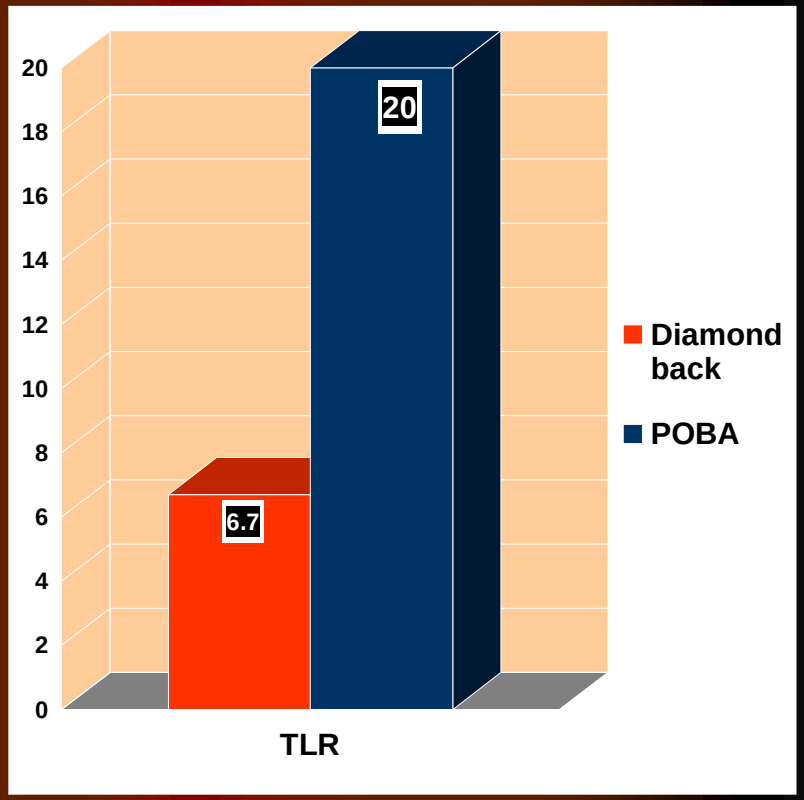
- Major adverse events: major amputation (above-the-ankle), death and TLR/TVR

CALCIUM 360° Study

Dissection, Bailout stenting,TLR

	Diamond-back 360°	Balloon Angioplasty
Dissections*	**3.3%**	**11.4%**
Bail-out stenting*	**2 (6.9%)**	**5 (14.3%)**

- Trend toward lower TLR
- Lower dissection rate and bail out stenting
- Higher freedom from major adverse events



Shammas NW et al. J Endovasc Ther 2012;19(4):480-8

COMPLIANCE 360º Study[1]
OAS Outperforms Balloon Angioplasty in ATK Lesions

- Prospective
- Multi-center

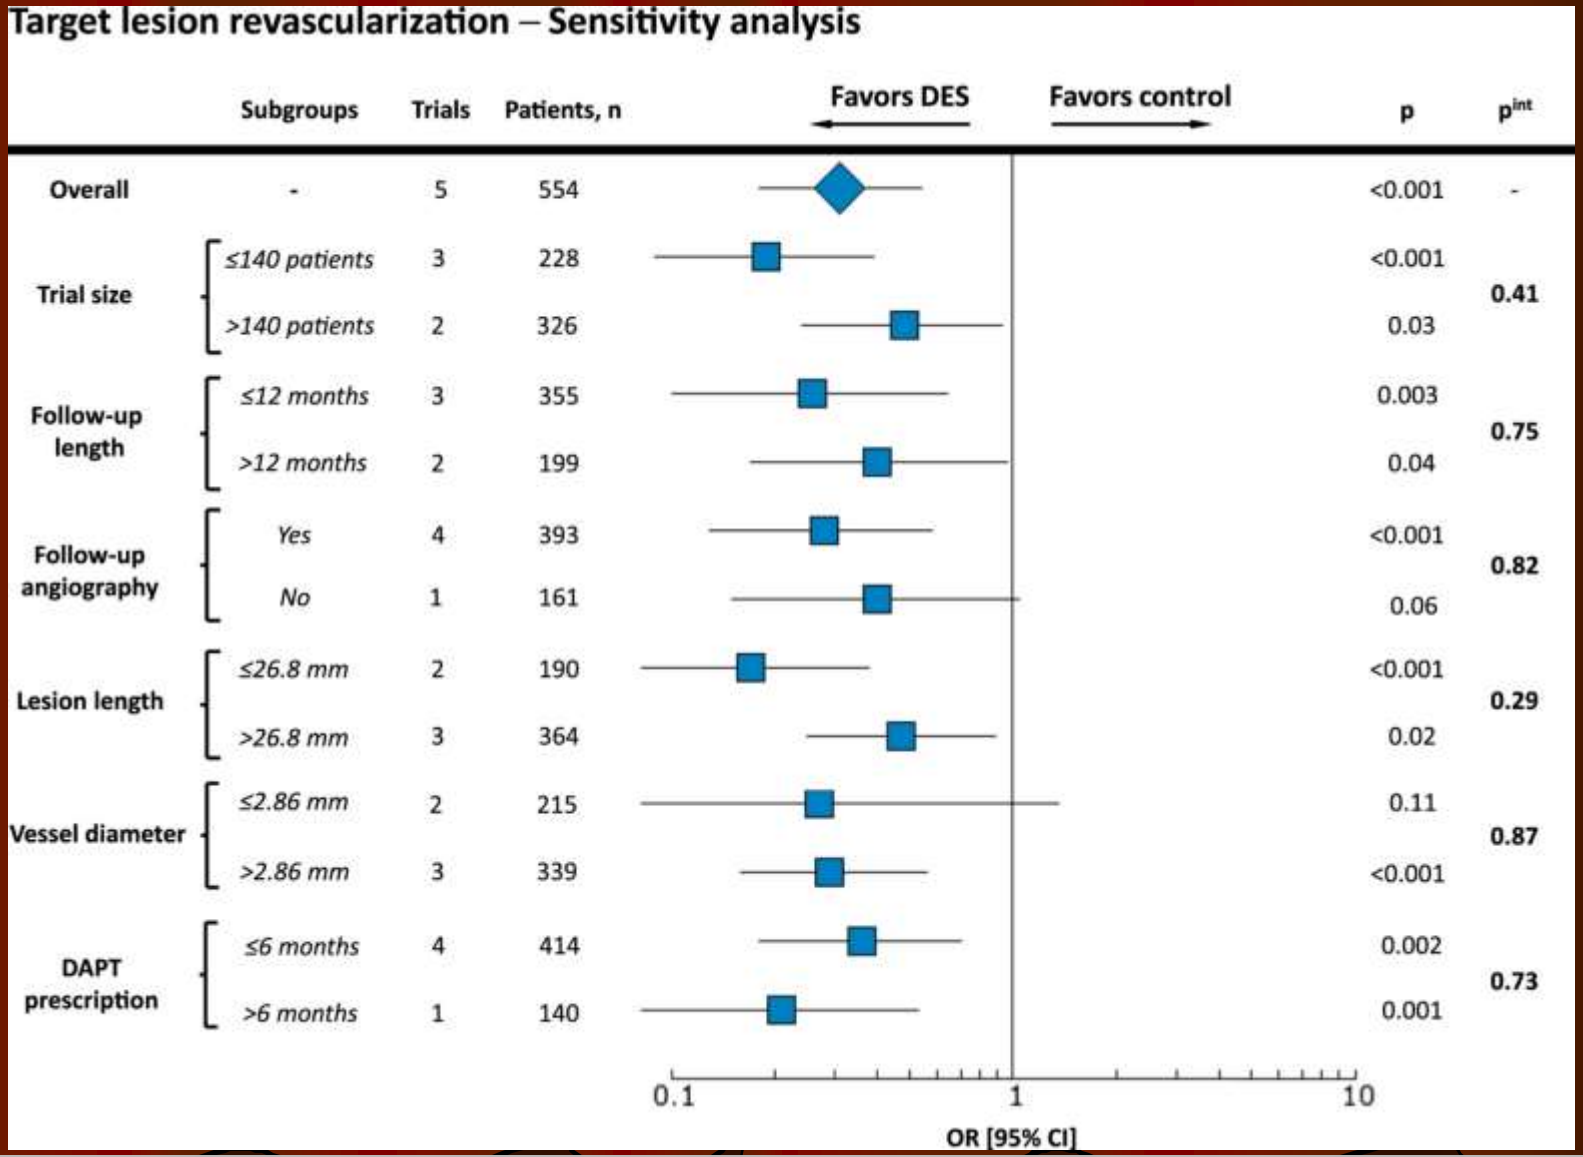
From: Drug-Eluting Stents for Revascularization of Infrapopliteal Arteries: Updated Meta-Analysis of Randomized Trials



J Am Coll Cardiol Intv. 2013;6(12):1284-1293. doi:10.1016/j.jcin.2013.08.007

Drug-eluting balloon versus standard balloon angioplasty for infrapopliteal arterial revascularization in critical limb ischemia: 12-month results from the IN.PACT DEEP randomized trial

Prospective, multicenter, randomized, controlled trial
358 CLI patients were randomized 2:1 to IA-DEB or PTA.

2 co-primary efficacy endpoints at 12 months:

1. clinically driven target lesion revascularization (CD-TLR) and
2. late lumen loss (LLL).

Primary efficacy results of DEB versus PTA were CD-TLR of 9.2% versus 13.1% (p = 0.291)

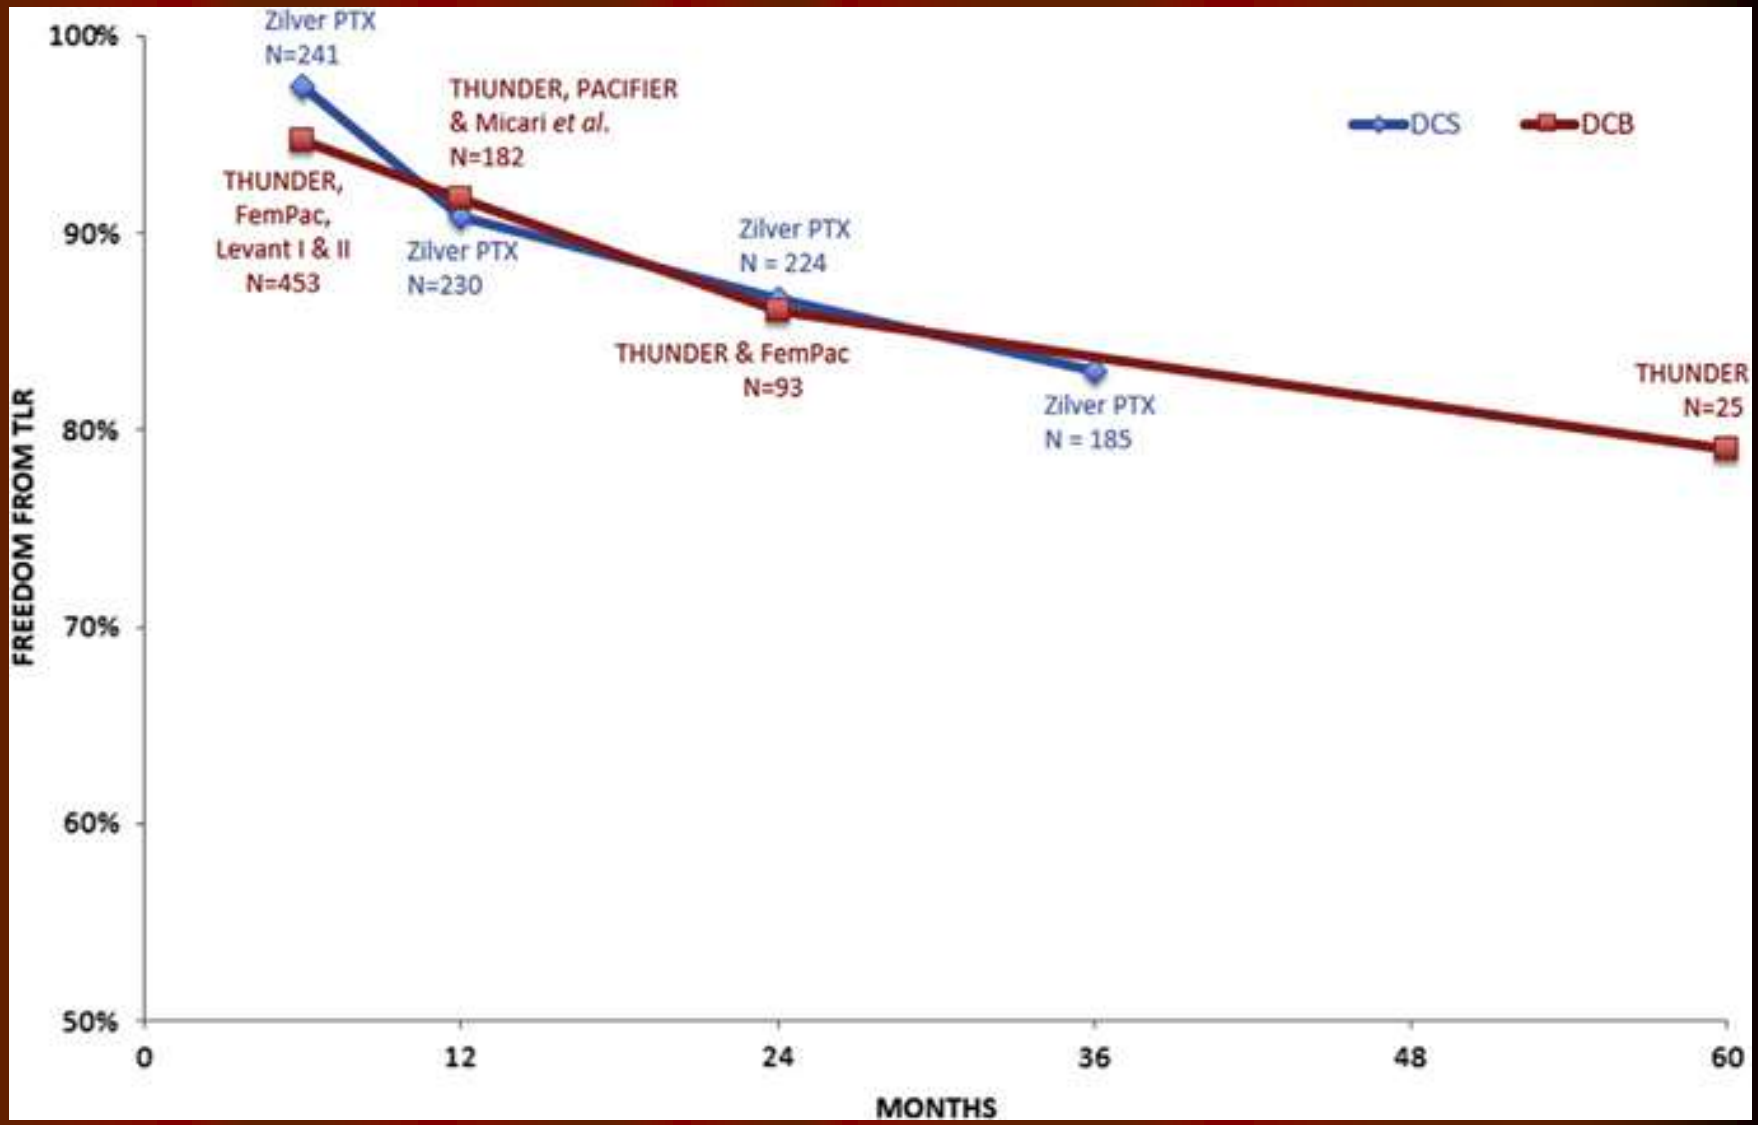
Primary safety endpoint through 6 months was a composite of all-cause mortality, major amputation, and CD-TLR.

Primary safety endpoints were 17.7% versus 15.8% (p = 0.021) and met the noninferiority hypothesis. Major amputations through 12 months was observed in the DEB arm versus the PTA arm (8.8% vs. 3.6%; p = 0.080).

Significant baseline differences between the DEB and PTA arms
impaired inflow (40.7% vs. 28.8%; p = 0.035),
previous target limb revascularization (32.2% vs. 21.8%; p = 0.047).

Zeller T et al. IN.PACT DEEP Trial Investigators. J Am Coll Cardiol. 2014 Oct 14;64(15):1568-76.

Drug Coated Balloons versus Drug Coated Stents



Sarode, K, Spelber D, Bhatt D…Banerjee S et al. JACC 2014

Summary

- Provisional stenting with BMS has same TLR and QOL when compared to Primary stenting of the FP segment
- Provisional stenting or primary stenting with DES has improved clinical outcomes compared to primary stenting with BMS or Provisional stenting with BMS. Data available for shorter lesions
- Atherectomy reduces dissection and stent rate and improves vessel compliance
- DCB are superior to POBA in reducing TLR and improves clinical outcomes
- *Combining Atherectomy with DCB likely reduces stent rate and reduces TLR*
- Potential disruptive technology on the horizon may include scoring drug coated balloons or drug coated Chocolate balloon (reduces both stent and TLR)

The optimal strategy in infrainguinal intervention will be a combination of reducing stenting, altering biology (antirestenotic drugs) and protecting distal vascular bed

THANK YOU
